

Dear Malomatia Hiring Team,

I'm applying for the Engineer - OpenAI & Chatbot Support position. With 12+ years in software engineering — including API integration, troubleshooting, and production support — I believe I can contribute to your enterprise AI and chatbot operations.

Integration and troubleshooting experience:

At a regional e-commerce marketplace, I built a payment integration layer unifying five fiat gateways (Stripe, PayTabs, HyperPay, Moyasar, Tap) and crypto processing (NOWPayments) behind one internal API. This involved REST APIs, JSON, authentication, webhooks, and troubleshooting dependent application integrations — the same skills your role requires for chatbot service support.

Production support and incident management:

As Deputy Head of Technical Affairs at Takamol, I owned ticket management, QA, release approvals, and production stability for a critical oil-sector system. I triaged issues, coordinated with development teams, validated releases across environments, and maintained operational documentation. This maps directly to your need for incident, problem, change, and release management.

AI-augmented development and prompt engineering:

I use Claude Code and GitHub Copilot daily for code generation, review, and documentation. I understand prompt configuration, version control, and the operational discipline required to maintain AI services reliably.

Technical foundation:

- Python, JavaScript, React, Next.js
- REST APIs, JSON, authentication, webhooks
- PostgreSQL, MySQL, Oracle — strong SQL and data management
- Docker, Linux, Git, CI/CD
- Logging, tracing, and root-cause analysis

I'm based in Damascus, Syria, and would require employer sponsorship to work in Qatar. I'm eligible under the bilateral agreement between Qatar and Syria and ready to complete all required processes upon receiving an offer.

I'd welcome the chance to discuss how my integration and support experience can contribute to Malomatia's AI services.

Best regards,

Mouhannad Allouf
